As part of this upgrade to 3D loader technologies, we will be replacing the API-based path from CS5’s legacy soft path object with a native GPU-based rendering path that leverages paths and texture maps, or “overlays” of your rendered output. They are a cheaper to render (GPU-based) alternative to traditional paths. The legacy soft-aperture path had several issues when used to produce 3D worlds, from the significant performance issues under certain lighting conditions, to the lack of control over ray-tracing. Working with texture-based paths, the API-based soft-path objects have been replaced with a native GPU-based route path, and we’ve added a texturing cache to retain an important performance and usability advantage under some lighting conditions. Soft-path overlays are an integral part of our 3D workflow, and we strongly recommend using them for textures, when possible. New to CS6 is a new selection merge tool that is designed for use where the user has two source selections that make up a joint selection such as two parts of a screen element, a clipping mask, or a nested selection. This tool merges the source selections into one selection, and the selection handles can be freely moved around. There is also an option to toggle showing or

hiding the input source selections. Starting with Photoshop CS6, there are three new tools to simplify and speed up the selection process: Quick Selection, Magnetic Lasso, and Quick Path. People frequently collect layers that have the same aspect ratio and then use Photoshop's Lasso tool to select the entire layer. Previously, you had to create a new layer or first select the area along the edges. Lasso is faster and more accurate than the other methods. Quicker than undoing, Quick Selection selects an area of a layer automatically.
